Contents

Acknowledgments .............................................. xii
Introduction ................................................... xiii

Chapter 1
The Pinhole
Overview and Expectations ................................. 2
A Little History: Conception and Connections .......... 2
The Conception ................................................. 2
Connections .................................................... 6
How a Daguerreotype Is Made ........................... 10
A Little Science ................................................ 13
Pinhole Construction ........................................ 16
Testing the Camera ........................................... 17
Finding the Correct Exposure ............................ 18
Making Pictures .............................................. 19
Pinhole Recommendations ............................... 20

Chapter 2
The Negative
Traditional and Alternative Options
Overview and Expectations ................................. 24
A Little History ............................................... 24
A Vision from 1760 ........................................... 26
An Appropriate Moment to Explain Things .............. 32
NEGATIVE PRODUCTION OPTIONS .................... 34
Commercial Labs ............................................. 34
The Copy Machine ............................................ 34
The Desktop Printer and Film Recorders ................. 34
Acrylic Films from Printed Sources ..................... 35
Polaroid Type 55 Positive/Negative Film ............... 38
A Quick Nod to Conventional Films .................... 39
More Negative Options: The Cliché-Verre ............... 40
SINGLE STAGE NEGATIVE-TO-NEGATIVE
DUPLICATING FILMS ....................................... 42
A FEW MULTISTAGE DUPLICATING FILMS ............. 43
Exposure and Development: Average Negative Densities . 44
Pyro ........................................................... 45
DAVE SOEMARKO’S LC-1 AND LC-1B LOW CONTRAST
DEVELOPER FORMULAS FOR LITH FILM ............ 45
Chapter 7
Cyanotype Variations
Fabrics and the New Cyanotype

Overview and Expectations ........................................... 124
Materials You Will Need .............................................. 124
Making the Image: Chemistry ....................................... 128
Coating the Fabric ...................................................... 129
Printing ............................................................... 129
Development ........................................................... 131
Oxidizer: “Intensification” ........................................... 132
Postprinting Washing Care .......................................... 133
THE NEW CYANOTYPE ............................................... 133
A Little History ......................................................... 133
The Five Shortcomings of the Traditional Cyanotype Process, According to Dr. Ware ........ 134
Chemical Solutions for the First Three Problems ............ 134
The Sensitizer .......................................................... 135
Preparation of Sensitizer ............................................ 135
Coating Techniques ................................................... 136
Drying the Coating ................................................... 136
Negatives .............................................................. 136
Exposure and Development ......................................... 137

Chapter 8
The Kallitypes
Van Dyke, B-V-D, and Kallitype

Overview and Expectations ........................................... 138
A Little History ........................................................ 140
THE VAN DYKE PROCESS ........................................... 142
Van Dyke Sensitizing Chemistry ................................... 142
The Paper ............................................................. 143
Sizing ................................................................. 144
The Negative .......................................................... 145
Coating the Paper ..................................................... 146
Exposure ............................................................... 146
Processing the Image .................................................. 147
TONING THE VAN DYKE IMAGE ................................. 149
THE BLUE-VAN-DYKE (B-V-D) PROCESS ..................... 151
THE KALLITYPE PROCESS ........................................... 154
The Kallitype Sensitizer ............................................... 154
Coating the Paper ..................................................... 156
Exposing the Print .................................................... 156
Developing the Print ................................................... 157
 DEVELOPMENT METHOD #1 ..................................... 157
 DEVELOPMENT METHODS #2 ................................. 158
A Toning Process for Kallitype ..................................... 159
Controlling Contrast with Potassium Dichromate ............ 160
Fixing the Print ......................................................... 160
Final Wash .............................................................. 161
THE BROWNPRINT PROCESS .................................... 161
The Brownprint Sensitizer .......................................... 162
Chapter 9

The Platinum/Palladium Process

Overview and Expectations .................................................. 164
A Little History ................................................................. 164
The Process Explained ......................................................... 168
Supplies and Materials ....................................................... 170
The Negative ................................................................. 172
Papers and Sizing ............................................................. 173
The Chemistry ................................................................. 174
Two Pt/Pd Developer Formulas .............................................. 175
The Clearing Baths ............................................................ 175
Formula for EDTA Clearing Bath .......................................... 175
The Sensitizer Formula ....................................................... 176
Preparing the Formula and Coating the Paper ......................... 178
Exposure ................................................................. 180
Best Advice ................................................................. 180
Developing the Platinum/Palladium Image ............................ 181
Prewashing and Clearing ..................................................... 181
Some Points to Consider: Trouble-shooting ......................... 183
Cyanotype, Gum, and Van Dyke with Pt/Pd ......................... 185

Chapter 10

The Ziatype Process

Overview and Expectations .................................................. 188
A Little History ................................................................. 188
A Little Chemistry .............................................................. 192
How It Works ................................................................. 193
The Working Process ......................................................... 194
Additional Considerations ................................................... 198
End Thoughts ................................................................. 199

Chapter 11

The Anthotype Process

Overview and Expectations .................................................. 200
A Little History ................................................................. 200
Anthotype Materials ........................................................... 202
The Working Process ......................................................... 202
Chapter 12

Paper

History, Preparation, Shrinking, Sizing, and Hardening

Overview and Expectations .................................................. 206
A Few Words About Paper and Its History ......................... 206
Shrinking ................................................................. 211
Sizing and Hardening ...................................................... 212
GELATIN SIZING AND HARDENING PROCESSES .......... 212
Gelatin Sizing .............................................................. 212
Materials You Will Need .................................................... 212
GELATIN SIZING: STEP 1 ............................................... 213
GELATIN HARDENING: STEP 2 ..................................... 213
Formalin Hardening Bath and Process:
A Step 2 Option ................................................................. 213
Glyoxal Hardening Bath and Process:
A Step 2 Alternative .......................................................... 215
GLYOXAL-GELATIN SINGLE-COATING OPTION ....... 215
Arrowroot Sizing .............................................................. 215
Gesso-Acrylic Medium Sizing ............................................ 216
Gloss Polyurethane Sizing .................................................. 217
Gum Arabic-Dichromate Sizing .......................................... 218

Chapter 13

The Gum Bichromate Process

Overview and Expectations .................................................. 220
A Little History ................................................................. 223
How Gum Bichromate Works ............................................. 226
A Few Words Before We Begin .......................................... 226
The Gum Negative ............................................................. 227
Registration ................................................................. 229
The Ammonium/Potassium Dichromate Sensitizer ............ 230
Watercolors ................................................................. 231
Gum Arabic ................................................................. 232
A Traditional Gum Bichromate Sensitizing Formula
(Ammonium Dichromate) ..................................................... 232
Another Sensitizer Formula (Potassium Dichromate) ....... 233
An Alternative Sensitizing Formula: "The 5-10-10" ......... 233
Sensitizing the Paper ....................................................... 233
A Few Words Regarding Conventional Gum Wisdom and Staining .................................................. 234
Coating ................................................................. 235
Exposing the Negative ..................................................... 235
Printing a Single Color Gum with a Single Negative ....... 236
Development: Clearing ...................................................... 237
Other Miscellaneous Trouble-Shooting Notes and Suggestions .................................................. 238
Chapter 14  
Dichromate Options  
3-D Gum, Alternative Surfaces for Gum, the Dusting-On Process, the Ferro-Tannic Process, and the Ferro-Gallate Process

Materials Needed ........................................... 358
How to Make It ............................................. 359

Appendix D

A Working Inventory Check Sheet

For an Alternative Process Curriculum, Workshop, or Studio ........................................... 360

Appendix E

A Modest List of Resources

Chemicals, Lab Gear, and Kits ............................... 366
Lab materials and art supplies ............................ 368
Films and Photographic Supplies ........................ 369
Negative Scans, Digital Resources, Books, Postcards, and Portfolios ......................... 371

Appendix F

Alternative Processes on the Internet ...................... 373

Appendix G

An Alternative Process Working Space ..................... 375

Appendix H

Selected Bibliography

Contemporary and Traditional Alternative Processes

Contemporary ................................................. 376
Early and Historical ........................................ 378

Index ..................................................................... 381
It is inconceivable to me that a book project of this magnitude could be realized without the generous support, knowledge, and wisdom of friends, fellow artists, and family. I would like to use this space to express my gratitude to those who have given me so much of themselves. A heartfelt thanks to my mother and father, Edie and George, for believing in my dreams of being an artist when I was young. Thanks to my uncle, Michael James, for showing me, by example, what it meant to be an artist. Most importantly, I thank my wife, Rebecca Welsh, for her love, patience, graceful balance, and excellent advice.

I make an especially deep bow of gratitude to Dan Estabrook, Judy Seigel, Dick Sullivan, and Michael Ware for their generous time and care in reading critical sections of my manuscript. The value of their advice, editing, and friendship has been immeasurable.

Special thanks go to my generous proofreaders and experimenters, Margaret Adams, Jody Ake,XTine Burrough, John Paul Caponigro, Brenton Hamilton, Julie Kahn, Sarah Van Kuren, Galina Manikova, Nancy Marshall, Bea Nettles, Bonnie Robinson, Mike Robinson, Stephen Savage, France Scully Osterman and Mark Osterman, Laurie Snyder, John Quackenbos, and Frank Varney. Thanks to Tom Kerr for his fine illustrations.

Thanks to my colleagues and playmates at the Art Institute of Boston at Lesley University, especially Stan Trecker and Angelo Fertitta, for seeing that I had a little release time to work on this book. Thanks also to those in the world’s archives: Mark Abbott, Angela Murphy, Claire Newman, and Joanna Druk at the Science Museum in London; Samantha Johnson, Claire Bertrand, and Debbie Ireland at the Royal Photographic Society; Katia Busch at Société Française de Photographie; Linda Briscoe at the Harry Ransom Research Center/University of Texas–Austin; Martha Hazen at Harvard University; Sylvia Inwood at the Detroit Institute of Arts; Lisa Kahan at Artists Rights Society; and Janice Madhu at the George Eastman House.

Grateful thanks also to my editor Jim Gish for his advice and good sense of humor, and to Tom Schin, Sandy Clark, Rachel Baker, Larry Main, Jaimie Wetzel, and Fionnuala McAvey at Delmar Publishers. Thanks to Zernicke Au, Andrew and Robin Cahan, Enna Dole, Konrad Eek and the Oklahoma Summer Arts Institute, Jesseca Ferguson, Don Ginther, Sarah Hasted, Barbara Hewitt, Charles Levy, David Lyman and the Maine Photographic Workshops, Phoebe McCormick, Mick at Lazertran, Elizabeth Opalenick, Martin Reed, Eric Renner, Nancy Spencer, Martha Schneider, Laurie Snyder, John Stevenson, Beth Ann South, Dave Soemarko, and Tim Whelen.

Last, but not least, my sincere thanks to all of the artists who allowed me to reproduce their excellent work in this book; your generosity, support, and enthusiasm were outstanding.
INTRODUCTION

The Book of Alternative Photographic Processes

This book represents a significant part of the evolution of my education as an artist and teacher of artists. For the last two decades I’ve been modifying and adding to these pages, and in their abbreviated form, they have served as working notes for my students. The content represents what we have learned together; pertinent and peculiar observations, techniques, anecdotes, and a good dose of interesting history to enhance the connections between the past and contemporary process. My intention was to create a resource that was interesting to read and “user friendly” and to write a flexible guide that would encourage the reader to see what might happen if they let their creativity, and interdisciplinary associations, out to play. To paraphrase Mark Twain: ... it hardly matters when your technique is great if your imagination is out of focus.

I have organized this book to meet the needs of several different audiences. For the teacher, the book is designed to be flexible and compatible with individual teaching styles, and I have done my best to make the contents accessible to “students” from high school through the professional levels. Teachers will be able to use this book to guide their students through the alternative photographic arts, via the generating of hand-made camera negatives through a logical evolution of alternative process techniques. It is very significant, to both teacher and student, that many of the wonderful illustrations in the book were made by students at all levels of instruction.

For the student, the book is designed as an inspirational and comprehensive technical resource because it addresses the historical, procedural, and interdisciplinary connections from the beginning of photography through digital. The word student implies someone in a class, but in truth we are all forever... students. In that regard, this book is a guide for photographic artists of all abilities and levels of knowledge.

The creative opportunities of alternative and non-silver photographic processes have been, until recently, relatively unexplored territory for contemporary artists. A recognition of the genre’s interdisciplinary possibilities is rapidly changing this situation, because creative people of all ages and disciplines are seeking modes of expression that best suit their intentions. They are embracing, in this digital age, the interdisciplinary potential of alternative processes; the marriage of nineteenth century handmade craft, science, and romanticism in concert with twenty-first century technologies and conceptual perceptions.

I’ve made every effort to avoid creating a book that functions as a dogmatic archetype or to serve the reader as a pedagogical and scientific model. You will discover that repeatable success in alternative image making will be based on a
willingness to enjoy making images for the process rather than the product. As you work, practiced techniques, patience, and attention to detail will reward your efforts. You will often see that it is the unexpected accident, in tandem with your practice, that will transform the science to art. It is often the logic of the unplanned effect that is one of the fine benefits of working in this discipline. It is this philosophy that has allowed our dexterity in the arts to evolve. If you get excited by challenges and are willing to enjoy the idiosyncrasies of alternative process, you will have wonderful times learning and will discover a vast menu of inspirations for your personal vision. The primary thing I would like you to remember is to enjoy your creative self and not to settle for the quick solution. Take your time and pay attention to your technique, small details, and chemical safety. In that regard, I have done my best to make this book a safe one to use. Always handle the chemistry with reasonable care, pay attention to my safety notices, and you will not have any problems.

Alternative and non-silver processes are somewhat mercurial in nature and full of surprises; enjoy their quirks and see them as opportunities. Much of what you will personally discover will emerge as a result of play, and your discoveries will be similar to the process of learning that you experienced as a child. If you stop to consider the things that you do best in your life you will come to the reasonable conclusion that your special, and unique, talents are ones that you taught yourself. This is the ebb and flow of how the animal kingdom learns, and it is called play. It is this play that delights the mind and stimulates the process of teaching yourself—just for the joy of it. That is, of course, why you decided it was a good idea to be an artist in the first place. This book, like you, will always be a work in progress.
